

MOM Tracking

Minutes of Meeting — Development Documentation, Kala Care ERP System

Prepared by: Vishal Chavan & Nikhil Reddy | **Date:** July 2026

1. Introduction

This document describes the **MOM Tracking** (Minutes of Meeting) module of the Kala Care ERP system. The module lets branch and master administrators conduct review meetings, record the discussion points and action items, assign responsibilities with due dates, and track each task to completion across successive meetings. Pending tasks automatically *carry forward* into the next meeting of the same branch, so nothing is lost between reviews. Employees see a read-only view of the tasks assigned to them.

The document is organised as follows: first the roles and **all requirements received from the client** are listed; then the **development is explained page by page** — each page section describes how the requirements were implemented, how the page is handled, and shows the screenshot of the delivered screen.

The module is organised into the following views:

- **New Meeting** — a guided wizard to build and finalize a meeting sheet.
- **MOM History** — every finalized meeting, filterable by branch and date.
- **Reports** — branch-wise roll-ups that drill into history.
- **Employee Report** — tasks assigned to a chosen person (admins) / **My MOM** for employees (their own tasks only).
- **Master Setup** — master discussion areas, categories and meeting types (Master Admin only).

2. Roles & Access

Role	Capabilities
Master Admin	Full access across all branches; conduct and finalize meetings; delete meetings; manage the Master Setup (discussion areas, categories, meeting types); view all reports and export.
Branch Admin	Conduct and finalize meetings for their own branch(es); view History, Reports and Employee Report scoped to their access branches; export (if permitted).
Employee	Read-only My MOM view — only the tasks assigned to them, with current status.

Table 1: Role-based access for the MOM Tracking module

Excel export is available to the Master Admin always, and to other users when the *can_export* permission is enabled on their account.

3. Client Requirements

The following requirements were received from the client and finalised for the MOM Tracking module.

- R1. Guided New-Meeting wizard.** A step-by-step wizard collects the meeting header (Date, Location, Meeting Type, Conducted by, Meeting Heads), the attendees, and the discussion sheet, validating each part before the minutes can be finalized.
- R2. Multi-branch (joint) meetings.** A single meeting can cover several branches at once. The primary branch is stored for compatibility, while the full list of covered branches is kept alongside it; manually added branches are also supported.
- R3. Attendees block.** Attendees can be added from the branch's employee list or typed manually, each marked **Present** or **Absent**, with the branch shown next to the name — mirroring the *Sr. No / Attendees* block of the paper sheet.
- R4. Discussion sheet.** Each row captures a **Discussion Area**, **Category** (colour-coded), **Discussion points** (bulleted lines), **Responsibility** (one or more people), an **Action** flag, an optional **Due Date**, a **Remark / Observation / Action**, and a **Status**.
- R5. Task vs Information rows.** Each row is flagged **T (Task)** or **I (Information)**. A Task has a responsibility, a due date and a status; an Information row may direct information at people but never carries a due date or status.
- R6. Status tracking.** Tasks move through **Pending**, **In Progress** and **Completed**. Only open (not-completed) tasks carry forward to the next meeting.
- R7. Carry-forward of open tasks.** When the branch(es) are selected, all pending tasks from previous meetings of those branches are pulled into the new sheet and marked with a **C/F** (carried-forward) badge. Each carried task keeps a stable tracking id so it can be followed across many meetings, and a **remark trail** records the observation/status from every past review of that task.

- R8. Master discussion areas pre-fill.** A master list of Discussion Areas pre-fills every new meeting sheet, so standard review points are always present and consistent across branches.
- R9. Auto-saved draft (never lose work).** The entire in-progress wizard state (branches, attendees, picked points, sheet rows and carried-task edits) is auto-saved to the server as the user types — one draft per user. A refresh, power cut or timeout restores the exact draft; it is cleared when the minutes are finalized or the wizard is reset, and stale drafts (older than 7 days) are discarded automatically.
- R10. Master Setup (Master Admin).** The Master Admin manages:
- **Discussion Areas** — the master points, each under a category, with soft delete so history is never broken.
 - **Categories** — colour-coded groupings for the discussion areas.
 - **Meeting Types** — the presets offered in the New-Meeting dropdown; meetings store the type as text, so removing a preset never affects saved meetings.
- R11. MOM History.** All finalized meetings are listed newest-first and can be filtered by branch and by meeting-date range. Any meeting can be opened for a full view; only the Master Admin can delete a meeting.
- R12. Reports.** Branch-wise reports summarise meeting activity and let the user jump straight into the corresponding History for a branch.
- R13. Employee Report / My MOM.** Admins can pick any employee (default: an overview) and see the tasks assigned to that person with their current status; employees get a read-only **My MOM** of their own assigned tasks only.
- R14. Excel export.** History, Reports and the meeting view export to a formatted **Minutes of Meeting** Excel sheet — header info block, numbered attendees, and the full discussion table (Discussion Area, Discussion points, Responsibility, Action flag, Due Date, Remark/Observation/Action, Status). Export respects the *can_export* permission.
- R15. PDF / print sheet.** The meeting can be printed or saved as a PDF in the same Minutes-of-Meeting layout, with carried tasks marked **(C/F)**.
- R16. Action flag legend.** **T** — Task, **I** — Information.
- R17. Reliability on a flaky database link.** Finalizing a meeting is retried automatically (up to three attempts) if the SQL Server connection drops mid-save. The transaction rolls back on failure, so a meeting is never saved partially, and the user is clearly told if it ultimately could not be saved.
- R18. Consistent India-local timestamps.** All meeting dates and audit timestamps are stored in India local time, so dates read the same for every user regardless of server or browser timezone.
- R19. Unicode-safe content.** Bullet characters, Devanagari names and other non-Latin text in discussion points and remarks are stored without corruption.

4. Data Model (Overview)

Entity	Purpose
Meeting	One finalized sheet — primary branch, full branch list, date, location, type, conducted-by and meeting heads.
Attendee	A person on the meeting (employee or manual), present/absent, with branch label.
Row	A discussion row — area, category, points, responsibility (list), flag (T/I), due date, status, remark, carried flag, tracking id and the remark trail.
Master Point	A master Discussion Area that pre-fills new sheets (soft-deletable).
Category	Colour-coded grouping for discussion areas.
Meeting Type	A preset offered in the New-Meeting dropdown.
Draft	The auto-saved in-progress wizard state — one per user.

Table 2: Key entities of the MOM Tracking module

5. Page-wise Development Process

This section explains, page by page, how the module was developed: what each screen does, how it was built, how it is handled by the user, which client requirements it covers, and the screenshot of the delivered screen.

5.1 New Meeting — Guided Wizard

Covers requirements R1, R2, R3, R8, R9.

Purpose. The entry point for conducting a meeting: a step-by-step wizard that builds the complete Minutes-of-Meeting sheet and finalizes it.

Development process.

- The wizard collects the **meeting header** — Date, Location, Meeting Type (from the Master Setup presets), Conducted by and Meeting Heads — and validates each part before the minutes can be finalized (R1).
- **Multi-branch (joint) meetings** were implemented (R2): several branches can be selected for one meeting; the primary branch is stored for compatibility while the full branch list is kept alongside it, and manually typed branches are also accepted.
- The **Attendees block** mirrors the paper sheet's *Sr. No / Attendees* layout (R3): people are picked from the branch's employee list or typed as guests, each marked Present or Absent with their branch shown next to the name.
- Selecting the branch(es) triggers the **master discussion areas pre-fill** (R8): the standard review points load into the sheet automatically, so every branch is reviewed against the same consistent checklist.
- The entire wizard state is **auto-saved as a server-side draft** while the user types — one draft per user (R9). A refresh, power cut or timeout restores the exact draft; finalizing or

resetting clears it, and drafts older than 7 days are discarded automatically.

How to handle. Fill the header → select branch(es) → mark attendees → complete the discussion sheet → finalize. Work can be interrupted at any point; the draft restores it on return.

Figure 1: New Meeting wizard — header, branches and attendees

5.2 New Meeting — Discussion Sheet

Covers requirements R4, R5, R6, R7, R16.

Purpose. The heart of the meeting: the row-by-row discussion table where points are recorded, tasks assigned and carried items reviewed.

Development process.

- Each row captures a **Discussion Area**, colour-coded **Category**, bulleted **Discussion points**, **Responsibility** (one or more people), an **Action flag**, an optional **Due Date**, a **Remark / Observation / Action** and a **Status** (R4).
- Rows are flagged **T (Task)** or **I (Information)** (R5, R16): a Task carries responsibility, due date and status; an Information row may direct information at people but never has a due date or status.
- **Status tracking** follows Pending → In Progress → Completed; only open tasks move to the next meeting (R6).
- **Carry-forward** was implemented (R7): when the branches are chosen, all pending tasks from previous meetings of those branches are pulled into the sheet with a **C/F** badge. Each carried task keeps a stable tracking id so it can be followed across many meetings, and its **remark trail** shows the observation and status from every past review.

How to handle. Review each pre-filled area, add points, assign responsibility and due dates for Tasks, update the status and remark of every carried (C/F) item, then finalize — open items will reappear automatically in the next meeting.

Action	S.no	Category	Discussion Area	Discussion points	Responsibility	Action flag	Due Date
	1	Sales	Sales target vs achievement (MTD)	• What was discussed / decided... + point	Unassigned	T I	—
	2	Finance	Outstanding payments & collections	• What was discussed / decided... + point	Unassigned	T I	—
	3	Service	AMC renewals due this month	• What was discussed / decided... + point	Unassigned	T I	—
	4	Service	Pending service calls / installations	• What was discussed / decided... + point	Unassigned	T I	—
	5	Service	Customer complaints & escalations	• What was discussed / decided... + point	Unassigned	T I	—
	6	Marketing	Active campaign progress & follow-ups	• What was discussed / decided... + point	Unassigned	T I	—
	7	Service	Spare parts / inventory status	• What was discussed / decided... + point	Unassigned	T I	—

Figure 2: Discussion sheet — tasks, responsibilities, due dates and carried-forward items

5.3 MOM History

Covers requirements R11, R14, R15.

Purpose. The archive of every finalized meeting.

Development process.

- All finalized meetings are listed **newest-first**, filterable by branch and by meeting-date range, with per-meeting task counts and progress shown in the list (R11).
- Any meeting opens into a **full sheet view**; only the Master Admin can delete a meeting (R11).
- **Excel export** produces the formatted Minutes-of-Meeting sheet — header info block, numbered attendees and the full discussion table — respecting the *can_export* permission (R14).
- The meeting can be **printed or saved as PDF** in the same Minutes-of-Meeting layout, with carried tasks marked (C/F) (R15).

How to handle. Filter by branch / date range → open **View sheet** for the full minutes → export to Excel or print / save as PDF when a copy is needed.

Figure 3: MOM History — all finalized meetings with branch and date filters

5.4 Reports

Covers requirements R12, R14.

Purpose. Branch-wise roll-ups of meeting activity for management review.

Development process.

- Summary tiles show total meetings, task completion %, open tasks, overdue tasks, information shared and average tasks per meeting (R12).
- Charts break the picture down: **tasks by status**, **task completion % by branch**, **tasks by category** and **meetings per month** — with a branch filter on top.
- Every roll-up links straight into the corresponding **MOM History** slice for that branch, so a number can always be drilled into its underlying meetings (R12).
- The report exports to Excel under the same *can_export* rule (R14).

How to handle. Pick a branch (or all branches), read the tiles and charts, and click through to History wherever detail is needed.

Figure 4: Reports — branch-wise meeting activity

5.5 Employee Report / My MOM

Covers requirement R13.

Purpose. A per-person view of assigned tasks — for admins across any employee, and for employees as their own read-only **My MOM**.

Development process.

- Admins pick any employee from the dropdown (default: an overview) and see meetings attended, branch meetings, and the person’s tasks split by Completed / Open / Overdue with a completion % (R13).
- The task table lists each assigned item with its Discussion Area, points, remark, category, owners, source meeting, due date and current status — so one screen answers “what is this person responsible for right now”.
- For employees the same page renders as **My MOM**: strictly read-only and limited to their own assigned tasks (R13), enforced by role on the server.

How to handle. Admins: choose the employee and review their open and overdue items before the next meeting. Employees: open My MOM to see what is assigned to them and its due dates.

Figure 5: Employee Report / My MOM — tasks assigned to a person

5.6 Master Setup (Master Admin only)

Covers requirements R8, R10.

Purpose. The master data behind every meeting sheet — maintained in one place by the Master Admin.

Development process.

- **Discussion Areas:** the master points that pre-fill every new sheet (R8), each assigned to a category. They are **soft-deleted**, so removing a point never breaks the history of meetings that used it (R10).
- **Categories:** colour-coded groupings; the colour carries through to the discussion sheet and the reports’ category chart.
- **Meeting Types:** the presets offered in the New-Meeting dropdown. Meetings store the type as plain text, so removing a preset never affects already-saved meetings (R10).

- Changes apply to **new meetings only** — finalized minutes are immutable.

How to handle. Open **Master setup** from the header → add or edit areas, categories and meeting types → Done. The next New Meeting picks up the changes automatically.

Figure 6: Master Setup — discussion areas, categories and meeting types

5.7 Cross-cutting: Reliability and Data Integrity

Covers requirements R17, R18, R19.

- **Flaky database link** (R17): finalizing a meeting retries automatically up to three attempts if the SQL Server connection drops mid-save; the transaction rolls back on failure, so a meeting is never saved partially, and the user is clearly told if it ultimately could not be saved.
- **India-local timestamps** (R18): all meeting dates and audit timestamps are stored in India local time, so dates read the same for every user regardless of server or browser timezone.
- **Unicode-safe content** (R19): bullet characters, Devanagari names and other non-Latin text in discussion points and remarks are stored without corruption.
